Prediction interval - Wikipedia

The prediction interval is conventionally written as: [, +].For example, to calculate the 95% prediction interval for a normal distribution with a mean (μ) of 5 and a standard deviation (σ) of 1, then z is approximately 2. Therefore, the lower limit of the prediction interval is approximately $5 - (2 \cdot 1) = 3$, and the upper limit is approximately $5 + (2 \cdot 1) = 7$, thus giving a prediction ...

Standard deviation - Simple English Wikipedia, the free ...

Basic example. Consider a group having the following eight numbers: , , , , , , , . These eight numbers have the average (mean) of 5: + + + + + + + = To calculate the population standard deviation, first find the difference of each number in the list from the mean.
